2.7**Study Guide**

For use with pages 122–131

GOAL Use properties of special pairs of angles.**Vocabulary**

Theorem 2.3 Right Angles Congruence Theorem: All right angles are congruent.

Theorem 2.4 Congruent Supplements Theorem: If two angles are supplementary to the same angle (or to congruent angles), then they are congruent.

Theorem 2.5 Congruent Complements Theorem: If two angles are complementary to the same angle (or to congruent angles), then they are congruent.

Postulate 12 Linear Pair Postulate: If two angles form a linear pair, then they are supplementary.

Theorem 2.6 Vertical Angles Congruence Theorem: Vertical angles are congruent.

EXAMPLE 1 Find angle measures

Complete the statement given that $m\angle AGF = 90^\circ$.

- $m\angle CGD = \underline{\quad?}$
- If $m\angle BGF = 113^\circ$, then $m\angle DGE = \underline{\quad?}$.

**Solution**

- Because $\angle CGD$ and $\angle AGF$ are vertical angles, $\angle CGD \cong \angle AGF$. By the definition of congruent angles, $m\angle CGD = m\angle AGF$. So, $m\angle CGD = 90^\circ$.
- By the Angle Addition Postulate, $m\angle BGF = m\angle AGF + m\angle AGB$. Substitute to get $113^\circ = 90^\circ + m\angle AGB$. By the Subtraction Property of Equality, $m\angle AGB = 23^\circ$. Because $\angle DGE$ and $\angle AGB$ are vertical angles, $\angle DGE \cong \angle AGB$. By the definition of congruent angles, $m\angle DGE = m\angle AGB$. So, $m\angle DGE = 23^\circ$.

Exercises for Example 1

Complete the statement given that $m\angle BHD = m\angle CHE = 90^\circ$.

- $m\angle AHG = \underline{\quad?}$
- $m\angle CHA = \underline{\quad?}$
- If $m\angle CHD = 31^\circ$, then $m\angle EHF = \underline{\quad?}$.
- If $m\angle BHG = 125^\circ$, then $m\angle CHF = \underline{\quad?}$.
- If $m\angle EHF = 38^\circ$, then $m\angle BHC = \underline{\quad?}$.

LESSON
2.7**Study Guide** *continued*
For use with pages 122–131**EXAMPLE 2** Find angle measures

If $m\angle BGD = 90^\circ$ and $m\angle CGD = 26^\circ$,
find $m\angle 1$, $m\angle 2$, and $m\angle 3$.

Solution

$\angle BGC$ and $\angle CGD$ are complementary.
So, $m\angle 1 = 90^\circ - 26^\circ = 64^\circ$.

$\angle AGB$ and $\angle BGD$ are supplementary.
So, $m\angle 2 = 180^\circ - 90^\circ = 90^\circ$.

$\angle AGF$ and $\angle CGD$ are vertical angles.
So, $m\angle 3 = 26^\circ$.

**Exercises for Example 2**

In Exercises 6 and 7, refer to Example 2.

6. Find $m\angle FGE$.

7. Find $m\angle DGE$.

EXAMPLE 3 Use algebra

Solve for x in the diagram.

Solution

Because $\angle AEB$ and $\angle BEC$ form a linear pair, the sum of their measures is 180° . So, you can solve for x as follows:

$$(2x + 3) + 25 = 180 \quad \text{Definition of supplementary angles.}$$

$$2x + 28 = 180 \quad \text{Combine like terms.}$$

$$2x = 152 \quad \text{Subtract 28 from both sides.}$$

$$x = 76 \quad \text{Divide each side by 2.}$$

**Exercises for Example 3**

Solve for x in the diagram.
